**Dear Process Mining Community,**

We are pleased to introduce the new version of LANA* - Share your dashboards with your organization, continue working actively during root-cause analysis and use individual charts in your dashboards! Collaborative and efficient teamwork with LANA Process Mining!

Your Lana Labs team!

* The update will be released on 22nd January at 8 PM CET. In the meantime, there may be some limitations in the usage of LANA Process Mining.

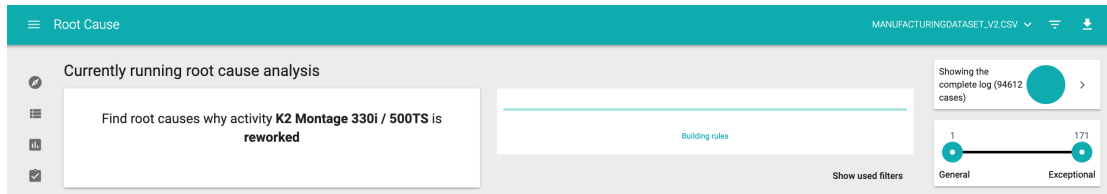

Share your dashboards with your colleagues!

With the interactive dashboards of LANA, you can create your own individual view of important KPIs and get all the results at one glance. Therefore, you have an overview of the execution of your processes at all time. Now you can share these dashboards with your organization. Simply share the log at the log management for your organization and all participants will have access to your created dashboard. This makes it even easier to collaborate and optimize your processes.

Continue working during your root-cause analysis!

From now on, you can continue to use LANA actively even during an automatic root-cause analysis instead of waiting for the results. With the use of machine learning, the root-cause analysis calculates complex relationships within the data while you can proceed with your work in the software. Activate your root-cause analysis as usual and keep an eye on the status of the analysis process. As soon as your analysis is completed, you will receive a notification and can view your results. This saves valuable time in which you can focus on other tasks while LANA automatically performs the complex analysis for you.

Combine existing charts and diagrams created in R in one dashboard!

Via our open LANA API, you can now directly integrate R diagrams adapted to your needs into the LANA dashboard. This enables the combination of standard diagrams with individual diagrams and limitless extension of visualization possibilities in LANA. Design a notebook-style dashboard to provide the best overview that visualizes your key figures.

Further improvements:

- Reduced lading times
- Improved bug tracking
- General performance improvements
